

Workshop demos — quick guide

Three live demos to run during the session, on your chosen toy-project folder.

Demo 1. Retrofit

Goal. Convert your toy-project folder into a sandbox repository with provenance and verification scaffolding.

Steps.

1. Open Claude Code at the root of your chosen toy-project folder (`toy-project-vdem/`, `toy-project-anes/`, or `toy-project-qog/`).
2. Run `/project-setup-existing`.
3. Confirm and let the skill scaffold the missing files.

Output. Folder now contains `README.md`, `implementation-roadmap.md`, `asset-registry.csv`, `interaction-log.csv`, and an `archive/` pattern. Every existing asset is entered into the registry with provenance (human / agent / mixed) and verification (not-verified / partially-verified / human-verified) flags.

Demo 2. Skill build

Goal. Produce a new reusable measurement skill (`/operationalize`) the agent can invoke on demand — in this project and any future project.

Steps.

1. From the same folder, run `/skill-writing operationalize`.
2. Supply the external source: Adcock & Collier 2001 (in `workshop-package/skills/sources/`).
3. Answer the self-interview prompts on your own measurement experience.
4. Review the draft skill; iterate once.

Output. A new `operationalize.md` file in `skills/`, structured as a named procedure with inputs, steps, and verification criteria, ready to be reused on any future measurement task.

Demo 3. Measurement dossier

Goal. Apply the four measurement skills in sequence to produce a complete measurement dossier on your toy project's latent variable.

Steps.

1. Run `/conceptualize` with your latent variable (`clientelism`, `political efficacy`, or `state capacity`).
2. Run `/operationalize` on the conceptualization output.
3. Run `/validate-construct` and `/assess-reliability` on the resulting indicator.
4. Review the dossier; flag remaining gaps in the asset registry.

Output. A measurement dossier in the toy-project folder containing: concept definition, operational indicator, construct-validity check, reliability assessment, and an audit-ready interaction log of every step.
